# PROJECT DELTA

# BACKGROUND

## The Paper

- ▶ From [OpenFMRI.org](https://openfmri.org/ds005) (ds005)
- ▶ "The Neural Basis of Loss Aversion in Decision Making"
- ▶ Sabrina M. Tom et al. (2007) in [Science](#)

## The Data

- ▶ 16 subjects, 1 task per subject, 3 runs per task
- ▶ Examine neural systems that process decision utility with fMRI data
- ▶ Task:
  - ▶ Subjects offered 50/50 wager
  - ▶ Varying potential gains/losses
  - ▶ Prompted for decision to accept or decline

# COMPLETING AND/OR IN PROGRESS

## Data Fetching and Preprocessing

- ▶ Download from [OpenFMRI.org](https://openfmri.org) and decompress
- ▶ Plot to explore potentially useful information
- ▶ Drawing summary statistics from plotted data
- ▶ Smoothing seasonal noise

## Initial Analysis

- ▶ Hypothesis testing
- ▶ Convolution
- ▶ Logistic Regression
- ▶ Linear regression
  - ▶ Multiple and single regression with stimulus

# OUR PLAN

### Goal

- ▶ To reproduce methods as well as adding our own thoughts into it
- ▶ Using other methods that may or may not come to the same conclusion

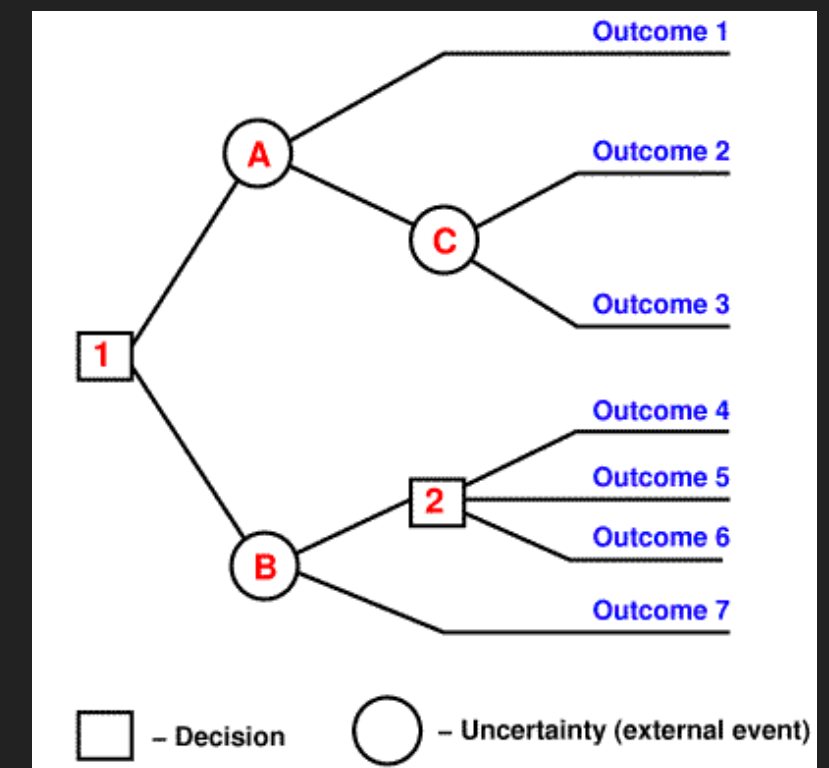

### Methods and Analyses to Perform

- ▶ Hypothesis tests
- ▶ Linear regression, Logistic regression, Correlation analysis
- ▶ Robust regression analysis, Principle component analysis

## OUR PLAN

### Methods and Analyses to Perform (cont'd)

- ▶ Support vector machines
  - ▶ Process: draw boundaries between clusters
  - ▶ Classify brain parts:
    - ▶ Parts (de)activate most when making decisions?
    - ▶ Parts are active given a good/bad/obvious/etc. wager?
    - ▶ Are these parts the same or different?
- ▶ Decision trees
  - ▶ Process: analyze inputs consecutively
    - ▶ Models human decision-making well
  - ▶ MANY questions:
    - ▶ What results from combinations of parts activating?
    - ▶ What results from combinations of gains/losses?
    - ▶ What parts activate given combinations of gains/losses?

# OUR PLAN

- ▶ Simplification steps
- ▶ Issues we have discussed
- ▶ Methods of validating models
  - ▶ t-tests
  - ▶ RSS
  - ▶ Cross-validation

## OUR PROCESS

### Most Difficult Parts of the Project

- ▶ Size of data
  - ▶ Spent much time deciphering format
  - ▶ What we need and don't need
- ▶ Writing tests for functions
  - ▶ Lack small piece of data that we know all about
  - ▶ Can improvise for simple functions only

### Issues Working as a Team

- ▶ Difficult for all to meet together
- ▶ Different styles of coding and documenting
- ▶ Difficult to communicate what we want to do
  - ▶ Don't tell each other what we plan to do
- ▶ Organizing GitHub repository

# OUR PROCESS

### Most Useful Parts of the Class

- ▶ Linear modelling
- ▶ Correlation per voxel

### Least Helpful Parts of the Class

- ▶ Comparison to R
- ▶ Mathematical writing

### What We Need to Accomplish in the Project

### Potential Topics to Cover in Future

- ▶ More linear regression, ANOVA, Principle component analysis
- ▶ Machine learning (classification, regression, cross-validation)
- ▶ Permutation tests (bootstrap)
- ▶ Software tools (Git, Python)
